

MS-7796 and MS-7794 LED replacement

Step 1.

Remove old LED unit from mirror by unscrewing the two lens cover bolts. Do not use rubber gasket as it will be reused.

Step 2.

Pull old LED unit from mirror with wires connected (Do not cut from back side). You will reuse the old wires to help pull the new LED units wires back through mirrors wire shaft.

Step 3.

Once the old LED unit has been removed and additional wires exposed, cut and attach new LED leads to the old wires. (**Note: Try to tape the wires with as little bulge as possible to allow them to be pulled back through the mirror with out problems**)

After the wires have been taped together fish both sets back through wire shaft and back out mirror base.

Step 4.

With wires now pulled through the mirror reinstall the LED unit in its correct direction and reattach cover lens with rubber gasket.

Reattach wire leads with correct wire couplings and seal with electrical tape.
